NEW QUESTION: 2Server1という名前のオンプレミスのMicrosoft SQL Serverがあります。Server2という名前のMicrosoft Azure SQL Databaseサーバーをプロビジョニングします。Server1で、DB1という名前のデータベースを作成します。DB1に対してStretch Database機能を有効にする必要があります。どの5つのアクションを順番に実行しますか？答えるには、適切な行動を行動のリストから回答領域に移動し、正しい順序で並べます。**Answer:** Explanation:ExplanationStep 1: Enable the remote data archive option in DB1Prerequisite: Enable Stretch Database on the serverBefore you can enable Stretch Database on a database or a table, you have to enable it on the local server. To enable Stretch Database on the server manually, run sp_configure and turn on the remote data archive option.Step 2: Create a firewall rule in AzureOn the Azure server, create a firewall rule with the IP address range of the SQL Server that lets SQL Server communicate with the remote server.Step 3: Create a master key in the master databaseTo configure a SQL Server database for Stretch Database, the database has to have a database master key. The database master key secures the credentials that Stretch Database uses to connect to the remote database.Step 4: Create a database scoped credential for authentication to Azure When you configure a database for Stretch Database, you have to provide a credential for Stretch

Database to use for communication between the on premises SQL Server and the remote Azure server. You have two options. Step 5: Create a server-level credential for authentication to Azure. To configure a database for Stretch Database, run the ALTER DATABASE command. For the SERVER argument, provide the name of an existing Azure server, including the .database.windows.net portion of the name - for example, MyStretchDatabaseServer.database.windows.net. Provide an existing administrator credential with the CREDENTIAL argument, or specify FEDERATED_SERVICE_ACCOUNT = ON. The following example provides an existing credential. ALTER DATABASE <database name> SET REMOTE_DATA_ARCHIVE = ON (SERVER = '<server_name>', CREDENTIAL = <db_scoped_credential_name>);
