**Answer: A**Explanation:The learning curve reflects the increased rate at which people perform tasks as they gain experience. The time required to perform a given task becomes progressively shorter. Ordinarily, the curve is expressed in a percentage of reduced time to complete a task for each doubling of cumulative production. One common assumption in a learning curve model is that the cumulative average time and labor cost) per unit is reduced by a certain percentage each time production doubles. Given a US \$120 cost per unit for the first 100 units and a US \$72 cost per unit when cumulative production doubled to 200 units, the learning curve percentage must be 60% (US \$72 - \$120). If production is again doubled to 400 units (four batches), the average unit labor cost should be US \$43.20 (\$72 x 60%). Hence, total labor cost for 400 units is estimated to be US \$17,280 (400 \$43.20).
