ExplanationRouting Traffic to an ELB Load BalancerIf you host a website on multiple Amazon EC2 instances, you can distribute traffic to your website across the instances by using an Elastic Load Balancing (ELB) load balancer. The ELB service automatically scales the load balancer as traffic to your website changes over time. The load balancer also can monitor the health of its registered instances and route domain traffic only to healthy instances.To route domain traffic to an ELB load balancer, use Amazon Route 53 to create an alias record that points to your load balancer. An alias record is a Route 53 extension to DNS. It's similar to a CNAME record, but you can create an alias record both for the root domain, such as example.com, and for subdomains, such as www.example.com. (You can create CNAME records only for subdomains.) Note Route 53 doesn't charge for alias queries to ELB load balancers or other AWS resources.PrerequisitesBefore you get started, you need the following:\* An ELB load balancer. You can use an ELB Classic, Application, or Network Load Balancer. For information about creating a load balancer, see Getting Started with Elastic Load Balancing in the Elastic Load Balancing User Guide Give the load balancer a name that will help you remember what it's for later. The name that you specify when you create a load balancer is the name that you'll choose when you create an alias record in the Route 53 console.\* A registered domain name. You can use Route 53 as your domain registrar, or you can use a different registrar.\* Route 53 as the DNS service for the domain. If you register your domain name by using Route 53, we automatically configure Route

53 as the DNS service for the domain. For information about using Route 53 as the DNS service provider for your domain, see Making Amazon Route 53 the DNS Service for an Existing Domain.

**NEW QUESTION:** 4 조직에서 VPC를 사용하여 RDS를 설정했습니다. 조직은 인터넷에서 RDS에 액세스하기를 원합니다. 이 시나리오에서 아래 언급된 구성 중 필요하지 않은 구성은 무엇입니까? **A.** 조직은 외부 IP가 있는 서브넷 그룹으로 RDS를 설정해야 합니다. **B.** 조직은 RDS VPC 보안 그룹의 인터넷 액세스를 허용해야 합니다. **C.** 조직은 콘솔에서 RDS 인스턴스를 공개적으로 액세스할 수 있게 하는 매개 변수를 활성화해야 합니다. **D.** 조직은 VPC 속성 DNS 호스트 이름 및 DNS 확인을 활성화해야 합니다. **Answer: A**  
Explanation: Explanation A Virtual Private Cloud (VPC) is a virtual network dedicated to the user's AWS account. It enables the user to launch AWS resources, such as RDS into a virtual network that the user has defined. Subnets are segments of a VPC's IP address range that the user can designate to a group of VPC resources based on security and operational needs. A DB subnet group is a collection of subnets (generally private) that the user can create in a VPC and which the user assigns to the RDS DB instances. A DB subnet group allows the user to specify a particular VPC when creating DB instances. If the RDS instance is required to be accessible from the internet: The organization must setup that the RDS instance is enabled with the VPC attributes, DNS hostnames and DNS resolution. The organization must enable the parameter in the console which makes the RDS instance publicly accessible. The organization must allow access from the internet in the RDS VPC security group.
