NEW QUESTION: 1 Refer to the exhibit. Which switch provides the spanning-tree designated port role for the network segment that services the printers?**A. Switch3B. Switch2C. Switch1D. Switch4****Answer: A****Explanation:**Explanation/Reference:Explanation:First, the question asks what switch services the printers, so it can be Switch 3 or Switch 4 which is connected directly to the Printers.Designated port is a port that is in the forwarding state. All ports of the root bridge are designated ports.Switch 3 and Switch 4 has same priority so it will see on lowest MAC address and here switch 3 has lowest MAC address. So switch 3 segment will play a Designated port role. By comparing the MAC address of Switch 3 and Switch 4 we found that the MAC of Switch 3 is smaller. Therefore, the interface connected to the Printers of Switch 3 will become designated interface and the interface of Switch 4 will be blocked.

Explanation:ExplanationStep 1: Add a new availability replica in asynchronous mode.

Asynchronous-commit mode minimizes transaction latency on the secondary databases but allows them to lag behind the primary databases, making some data loss possible.Incorrect:

Add a new availability replica in synchronous mode.Synchronous-commit mode ensures that once a given secondary database is synchronized with the primary database, committed transactions are fully protected. This protection comes at the cost of increased transaction latency.Step 2: Set Readable Secondary to Read-intent only.For the secondary role, select a new value from the Readable secondary drop list, as follows: Read-intent only Only read-only connections are allowed to secondary databases of this replica. The secondary database(s) are all available for read access.Step 3: Configure read-only routing.Note: Read-only routing refers to the ability of SQL Server to route qualifying read-only connection requests to an available Always On readable secondary replica (that is, a replica that is configured to allow read-only workloads when running under the secondary role). To support read-only routing, the availability group must possess an availability group listener. Read-only clients must direct their connection requests to this listener, and the client's connection strings must specify the

application intent as "read-only." That is, they must be read-intent connection requests.
