**NEW QUESTION: 1** Refer to the exhibit. Why is R3 unable to install 1.1.1.1/32 in its routing table?  
**A.** 11.11.11.11/32 is advertising in the BGP table, so conditional advertising is not working.  
**B.** The bgp redistribute-internal command is missing under the R2 BGP process.  
**C.** 11.11.11.11/32 exists in the routing table, so the conditional advertising is not working.  
**D.** The route is filtered out by the ip prefix-list ROUTE-IN command.  
**Answer: D**

**NEW QUESTION: 2** You need to recommend a design that meets the technical requirements for communication between Fabrikam and ADatum. Which three actions should you perform in fabrikam.com? (Each correct answer presents part of the solution. Choose three.)  
**A.** From EDGE1, create a Send connector that has an address space for adatum.com  
**B.** Run the Set-TransportConfig cmdlet.  
**C.** Run the Set-TransportServer cmdlet.  
**D.** Create a remote domain for adatum.com.  
**E.** From a Mailbox server, create a Send connector that has an address space for adatum.com.  
**F.** Exchange certificates with the administrators of adatum.com.  
**Answer: B,E,F**  
Explanation: Explanation/Reference: Explanation: B: To activate SSL encryption on an Exchange server, you need a server certificate on the Client Access Server in each company. The client access server is the internet facing server in an organization. An SSL certificate is a digital certificate that authenticates the identity of the exchange server and encrypts information that is sent to the server using Secure Sockets Layer (SSL) technology Mailbox server certificates One key difference between Exchange 2010 and Exchange 2013 is that the certificates that are used on the Exchange 2013 Mailbox server are self-signed certificates. Because all clients connect to an Exchange 2013 Mailbox server through an Exchange 2013 Client Access server, the only certificates that you need to manage are those on the Client Access server. The Client Access server automatically trusts the self-signed certificate on the Mailbox server, so clients will not receive warnings about a self-signed certificate not being trusted, provided that the Client Access server has a non-self-signed certificate from either a Windows certification authority (CA) or a trusted third party. There are no tools or cmdlets available to manage self-signed certificates on the Mailbox server. After the server has been properly installed, you should never need to worry about the certificates on the Mailbox server. D: Use the Set-TransportConfig cmdlet to modify the transport configuration settings for the whole Exchange organization. F: If you want to ensure secure, encrypted communication with a partner, you can create a Send connector that is configured to enforce Transport Layer Security (TLS) for messages sent to a partner domain. TLS provides secure communication over the Internet. Use the EAC to create a Send connector to send email to a partner, with TLS applied To create a Send connector for this scenario, log in to the EAC and perform the following steps: In the EAC, navigate to Mail flow > Send connectors, and then click Add. In the New send connector wizard, specify a name for the send connector and then select Partner for the Type. When you select Partner, the connector is configured to allow connections only to servers that

authenticate with TLS certificates. Click Next. Verify that MX record associated with recipient domain is selected, which specifies that the connector uses the domain name system (DNS) to route mail. Click Next. Under Address space, click Add. In the Add domain window, make sure SMTP is listed as the Type. For Fully Qualified Domain Name (FQDN), enter the name of your partner domain. Click Save. For Source server, click Add. In the Select a server window, select a Mailbox server that will be used to send mail to the Internet via the Client Access server and click Add. After you've selected the server, click Add. Click OK. Click Finish. Once you have created the Send connector, it appears in the Send connector list. In Microsoft Exchange Server 2013, a Send connector controls the flow of outbound messages to the receiving server. They are configured on Mailbox servers running the Transport service. Most commonly, you configure a Send connector to send outbound email messages to a smart host or directly to their recipient, using DNS. Exchange 2013 Mailbox servers running the Transport service require Send connectors to deliver messages to the next hop on the way to their destination. Send connectors that are created on Mailbox servers are stored in Active Directory and are available to all Mailbox servers running the Transport service in the organization.

**NEW QUESTION: 3** From the MFA Server blade, you open the Block/unblock users blade as shown in the exhibit. What caused AlexW to be blocked? **A.** An administrator manually blocked the user. **B.** The user reported a fraud alert when prompted for additional authentication. **C.** The user entered an incorrect PIN four times within 10 minutes. **D.** The user account password expired. **Answer: B**
