NEW QUESTION: 1A. Option AB. Option EC. Option CD. Option DE. Option B Answer: B,D
Explanation:Explanation: VRRP AdvertisementsThe virtual router master sends VRRP advertisements to other VRRP routers in the same group. The advertisements communicate the priority and state of the virtual router master. The VRRP advertisements are encapsulated in IP packets and sent to the IP Version 4 multicast address assigned to the VRRP group. The advertisements are sent every second by default; the interval is configurable.Although the VRRP protocol as per RFC 3768 does not support millisecond timers, Cisco routers allow you to configure millisecond timers. You need to manually configure the millisecond timer values on both the primary and the backup routers. The master advertisement value displayed in the show vrrp command output on the backup routers is always 1 second because the packets on the backup routers do not accept millisecond values.You must use millisecond timers where absolutely necessary and with careful consideration and testing. Millisecond values work only under favorable circumstances, and you must be aware that the use of the millisecond timer values restricts VRRP operation to Cisco devices only.

NEW QUESTION: 3あなたの会社は、Amazon Web Services (AWS) で大規模な寄付ウェブサイトをホストする予定です。多くのデータベース書き込みを作成する大量かつ未定のトラフィックが予想されます。AWSでホストされているデータベースへの書き込みを削除しないようにしてください。

どのサービスを使用する必要がありますか？ **A.**

予想されるピーク書き込みスループットまでの書き込みスループットがプロビジョニングされたAmazon DynamoDB。 **B.**

書き込みをキャプチャし、データベースに書き込むためにキューを空にするAmazon Simple Queue Service (SQS)。 **C.**

予想されるピーク書き込みスループットまでIOPSがプロビジョニングされたAmazon RDS。 **D.**

書き込みがデータベースにコミットされるまで書き込みを保存するAmazon ElastiCache。

Answer: B Explanation: Explanation Amazon Simple Queue Service (Amazon SQS) offers a reliable, highly scalable hosted queue for storing messages as they travel between computers. By using Amazon SQS, developers can simply move data between distributed application components performing different tasks, without losing messages or requiring each component to be always available. Amazon SQS makes it easy to build a distributed, decoupled application, working in close conjunction with the Amazon Elastic Compute Cloud (Amazon EC2) and the other AWS infrastructure web services. What can I do with Amazon SQS? Amazon SQS is a web service that gives you access to a message queue that can be used to store messages while waiting for a computer to process them. This allows you to quickly build message queuing applications that can be run on any computer on the internet. Since Amazon SQS is highly scalable and you only pay for what you use, you can start small and grow your application as you wish, with no compromise on performance or reliability. This lets you focus on building sophisticated message-based applications, without worrying about how the messages are stored and managed. You can use Amazon SQS with software applications in various ways. For example, you can: Integrate Amazon SQS with other AWS infrastructure web services to make applications more reliable and flexible. Use Amazon SQS to create a queue of work where each message is a task that needs to be completed by a process. One or many computers can read tasks from the queue and perform them. Build a microservices architecture, using queues to connect your microservices. Keep notifications of significant events in a business process in an Amazon SQS queue. Each event can have a corresponding message in a queue, and applications that need to be aware of the event can read and process the messages.
