NEW QUESTION: 2 On which three options can Cisco PfR base its traffic routing? (Choose three.) A. Router IOS version B. Time of day C. Load-balancing requirements D. User-defined link capacity thresholds E. Network performance F. An access list with permit or deny statements

Answer: C, D, E Explanation: Key Advantages of using PfR for Load balancing: - Utilization based load-balancing: PfR takes real-time link utilization into account when load balancing the links. This will ensure that a link will not go beyond a certain percentage of its maximum capacity (75% by default). - Application Performance based Load Balancing: PfR does not randomly forward traffic through one link or another. It takes application performance requirements into consideration and then forwards the traffic through a link which meets the performance policy requirements. PfR also load balances the link at the same time. - Bi-directional Solution: PfR is a bi-directional load balancing solution which influences outbound as well as in-bound traffic. - Consolidated Centralized View: PfR offers consolidated and centralized view of the state of all external links in the network. At any given time, the network administrator can see the current link utilization (in kbps and percentage of its capacity), maximum link threshold, and the policies applied to the links in the network.
