NEW QUESTION: 1 DRAG DROP You plan to deploy a cloud service named contosoapp. The service includes a web role named contosowebrole. The web role has an endpoint named restrictedEndpoint. You need to allow access to restricted Endpoint only from your office machine using the IP address 145.34.67.82. Which values should you use within the service configuration file? To answer, drag the appropriate value to the correct location in the service configuration file. Each value may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content. **Answer:** Explanation: * Rule with lower order are applied first. * We can selectively permit or deny network traffic (in the management portal or from PowerShell) for a virtual machine input endpoint by creating rules that specify "permit" or "deny". By default, when an endpoint is created, all traffic is permitted to the endpoint. So for that reason, it's important to understand how to create permit/deny rules and place them in the proper order of precedence to gain granular control over the network traffic that you choose to allow to reach the virtual machine endpoint. Note that at the instant you add one or more "permit" ranges, you are denying all other ranges by default. Moving forward from the first permit range, only packets from the permitted IP range will be able to communicate with the virtual machine endpoint.

NEW QUESTION: 2 다음 중 Amazon Route 53 리소스 레코드에 해당하는 것은 무엇입니까? 답변 2 개 선택 **A.** Amazon Route 53 Alias 레코드는 어디에서나 호스팅되는 모든 DNS 레코드를 가리킬 수 있습니다. **B.** 영역 정점에 대한 CNAME 레코드를 만들 수 있습니다. **C.** Amazon Route 53에서 별칭 레코드에 TTL을 설정할 수 있습니다. **D.** 별칭 레코드는 하나의 DNS 이름을 다른 Amazon Route 53 DNS 이름에 매핑할 수 있습니다. **E.** Amazon Route 53 CNAME 레코드는 어디에서나 호스팅되는 모든 DNS 레코드를 가리킬 수 있습니다. **Answer: D, E** Explanation: Explanation <https://aws.amazon.com/route53/faqs/> Amazon Route 53 offers 'Alias' records (an Amazon Route 53-specific virtual record). Alias records are used to map resource record sets in your hosted zone to Amazon Elastic Load Balancing load

balancers, Amazon CloudFront distributions, AWS Elastic Beanstalk environments, or Amazon S3 buckets that are configured as websites. Alias records work like a CNAME record in that you can map one DNS name (example.com) to another 'target' DNS name (elb1234.elb.amazonaws.com).

<http://docs.aws.amazon.com/Route53/latest/DeveloperGuide/resource-record-sets-choosing-alias-non-alias.html> A CNAME record can point to any DNS record hosted anywhere, including to the resource record set that Amazon Route 53 automatically creates when you create a policy record.

NEW QUESTION: 3 You need to configure SharePoint for the appropriate protection of merger documents. What should you do?
A. Configure Web Part security.
B. Configure Information Rights Management.
C. Configure document conversions.
D. Configure document library permissions.
Answer: B
