**NEW QUESTION: 1**An online retailer needs to regularly process large product catalogs, which are handled in batches. These are sent out to be processed by people using the Amazon Mechanical Turk service, but the retailer has asked its Solutions Architect to design a workflow orchestration system that allows it to handle multiple concurrent Mechanical Turk operations, deal with the result assessment process, and reprocess failures. Which of the following options gives the retailer the ability to interrogate the state of every workflow with the LEAST amount of implementation effort?  
**A.** Hold workflow information in an Amazon RDS instance with AWS Lambda functions polling RDS for status changes. Worker Lambda functions then process the next workflow steps. Amazon QuickSight will visualize workflow states directly out of Amazon RDS.  
**B.** Build the workflow in AWS Step Functions, using it to orchestrate multiple concurrent workflows. The status of each workflow can be visualized in the AWS Management Console, and historical data can be written to Amazon S3 and visualized using Amazon QuickSight.  
**C.** Trigger Amazon CloudWatch alarms based upon message visibility in multiple Amazon SQS queues (one queue per workflow stage) and send messages via Amazon SNS to trigger AWS Lambda functions to process the next step. Use Amazon ES and Kibana to visualize Lambda processing logs to see the workflow states.  
**D.** Use Amazon SWF to create a workflow that handles a single batch of catalog records with multiple worker tasks to extract the data, transform it, and send it through Mechanical Turk. Use Amazon ES and Kibana to visualize AWS Lambda processing logs to see the workflow states.  
**Answer: B**  
**Explanation:** AWS Step Functions is a fully managed service that makes it easy to coordinate the components of distributed applications and microservices using visual workflows. Instead of writing a Decider program, you define state machines in JSON. AWS customers should consider using Step Functions for new applications. If Step Functions does not fit your needs, then you should consider Amazon Simple Workflow (SWF). Amazon SWF provides you complete control over your orchestration logic, but increases the complexity of developing applications. You may write decider programs in the programming language of your choice, or you may use the Flow framework to use programming constructs that structure asynchronous interactions for you. AWS will continue to provide the Amazon SWF service, Flow framework, and support all Amazon SWF customers.

**NEW QUESTION: 2**You are a SharePoint administrator for Wingtip Toys. The company has a

main office and 10 distribution centers. The main office is located in Miami. The company has 36 departments. Each department has a department manager. You need to plan a solution that meets the company's taxonomy requirements. You must ensure that the taxonomy for the legal documents is isolated. What should you include in the solution? **A.** multiple Site Collection policies **B.** a Legal site collection **C.** a Web application zone **D.** multiple Managed Metadata Service applications **Answer: D**

**NEW QUESTION: 3** Your network contains an Active Directory Rights Management Services (AD RMS) cluster. You have several custom policy templates. The custom policy templates are updated frequently. Some users report that it takes as many as 30 days to receive the updated policy templates. You need to ensure that users receive the updated custom policy templates within seven days. What should you do? **A.** Change the schedule of the AD RMS Rights Policy Template Management (Automated) scheduled task. **B.** Change the schedule of the AD RMS Rights Policy Template Management (Manual) scheduled task. **C.** Modify the registry on the AD RMS servers. **D.** Modify the registry on the users' computers. **Answer: D** Explanation: Reference: <http://technet.microsoft.com/en-us/library/cc771971.aspx> Configuring the AD RMS client The automated scheduled task will not query the AD RMS template distribution pipeline each time that this scheduled task runs. Instead, it checks updateFrequency DWORD value registry entry. This registry entry specifies the time interval (in days) after which the client should update its rights policy templates. By default the registry key is not present on the client computer. In this scenario, the client checks for new, deleted, or modified rights policy templates every 30 days. To configure an interval other than 30 days, create a registry entry at the following location: HKEY\_CURRENT\_USER\Software\Policies\Microsoft\MSDRM\TemplateManagement. In this registry key, you can also configure the updateIfLastUpdatedBeforeTime, which forces the client computer to update its rights policy templates. Topic 3, Volume C
