A. Header manipulation **B.** XML injection **C.** Cross-site script **D.** SQL injection
Answer: D
Explanation: Section: Threats and Vulnerabilities
Explanation/Reference: Explanation: The code in the question is an example of a SQL Injection attack. The code '1==1' will always provide a value of true. This can be included in statement designed to return all rows in a SQL table. SQL injection is a code injection technique, used to attack data-driven applications, in which malicious SQL statements are inserted into an entry field for execution (e.g. to dump the database contents to the attacker). SQL injection must exploit a security vulnerability in an application's software, for example, when user input is either incorrectly filtered for string literal escape characters embedded in SQL statements or user input is not strongly typed and unexpectedly executed. SQL injection is mostly known as an attack vector for websites but can be used to attack any type of SQL database.
