[https://en.wikipedia.org/wiki/Cloud\\_computing](https://en.wikipedia.org/wiki/Cloud_computing) Another example of hybrid cloud is one where IT organizations use public cloud computing resources to meet temporary capacity needs that can not be met by the private cloud.[71] This capability enables hybrid clouds to employ cloud bursting for scaling across clouds.[3] Cloud bursting is an application deployment model in which an application runs in a private cloud or data center and "bursts" to a public cloud when the demand for computing capacity increases. A primary advantage of cloud bursting and a hybrid cloud model is that an organization only pays for extra compute resources when they are needed.[72] Cloud bursting enables data centers to create an in-house IT infrastructure that

supports average workloads, and use cloud resources from public or private clouds, during spikes in processing demands.[73]
