Answer: A

NEW QUESTION: 2A vSphere Administrator notices that the newly deployed ESXi hosts cannot stay in a connected state invCenter Server for more than 60 seconds at a time. The Administrator knows that the hardware is in goodhealth and that the ESXi hypervisors are properly configured.What is the source of the problem?**A.** Firewall rules that have too many ports open.**B.** The hosts do not have persistent logging configured.**C.** The hosts are not a part of a vSphere Distributed Switch.**D.** Firewall rules preventing hosts from sending heartbeats to vCenter Server.**Answer: D**

NEW QUESTION: 3 If a port configured with STP loop guard stops receiving BPDUs, the port will

be put into which state?**A.** Forwarding state**B.** Learning state**C.** Listening state**D.** Loop-inconsistent state**Answer: D**Explanation:STP Loop GuardFeature DescriptionThe STP loop guard feature provides additional protection against Layer 2 forwarding loops (STPloops). An STP loop is created when an STP blocking port in a redundant topology erroneously transitions to the forwarding state. This usually happens because one of the ports of a physicallyredundant topology (not necessarily the STP blocking port) no longer receives STP BPDUs. In itsoperation, STP relies on continuous reception or transmission of BPDUs based on the port role.The designated port transmits BPDUs, and the non-designated port receives BPDUs.When one of the ports in a physically redundant topology no longer receives BPDUs, the STPconceives that the topology is loop free. Eventually, the blocking port from the alternate or backupport becomes designated and moves to a forwarding state. This situation creates a loop.The loop guard feature makes additional checks. If BPDUs are not received on a non-designatedport, and loop guard is enabled, that port is moved into the STP loop-inconsistent blocking state,instead of the listening / learning / forwarding state. Without the loop guard feature, the portassumes the designated port role. The port moves to the STP forwarding state and creates a loop.When the loop guard blocks an inconsistent port, this message is logged:CatOS%SPANTREE-2-LOOPGUARDBLOCK: No BPDUs were received on port 3/2 in vlan 3.Moved to loop-inconsistent state.Cisco IOS%SPANTREE-2-LOOPGUARD_BLOCK: Loop guard blocking port FastEthernet0/24 onVLAN0050.Once the BPDU is received on a port in a loop-inconsistent STP state, the port transitions intoanother STP state. According to the received BPDU, this means that the recovery is automaticand intervention is not necessary. After recovery, this message is logged:CatOS%SPANTREE-2-LOOPGUARDUNBLOCK: port 3/2 restored in vlan 3.Cisco IOS%SPANTREE-2-LOOPGUARD_UNBLOCK: Loop guard unblocking portFastEthernet0/24 on VLAN0050.Reference http://www.cisco.com/en/US/tech/tk389/tk621/technologies_tech_note09186a0080094640.shtml
