**NEW QUESTION: 1** A security administrator needs to image a large hard drive for forensic analysis. Which of the following will allow for faster imaging to a second hard drive?  
**A.** `cp /dev/sda /dev/sdb bs=8k`  
**B.** `tail -f /dev/sda > /dev/sdb bs=8k`  
**C.** `dd in=/dev/sda out=/dev/sdb bs=4k`  
**D.** `locate /dev/sda /dev/sdb bs=4k`  
**Answer: C**  
**Explanation:** `dd` is a command-line utility for Unix and Unix-like operating systems whose primary purpose is to convert and copy files. `dd` can duplicate data across files, devices, partitions and volumes. On Unix, device drivers for hardware (such as hard disks) and special device files (such as `/dev/zero` and `/dev/random`) appear in the file system just like normal files; `dd` can also read and/or write from/to these files, provided that function is implemented in their respective driver. As a result, `dd` can be used for tasks such as backing up the boot sector of a hard drive, and obtaining a fixed amount of random data. The `dd` program can also perform conversions on the data as it is copied, including byte order swapping and conversion to and from the ASCII and EBCDIC text encodings. An attempt to copy the entire disk using `cp` may omit the final block if it is of an unexpected length; whereas `dd` may succeed. The source and destination disks should have the same size.

**A.** Risk assessment reports  
**B.** Return on security investment report  
**C.** Business impact analysis (BIA)  
**D.** Security metrics reports  
**Answer: A**  
**Explanation:** Performing a risk assessment will allow the information security manager to prioritize the remedial measures and provide a means to convey a sense of urgency to management. Metrics reports are normally contained within the methodology of the risk assessment to give it credibility and provide an ongoing tool. The business impact analysis

(BIA) covers continuity risks only. Return on security investment cannot be determined until a plan is developed based on the BIA.
