NEW QUESTION: 2A technician installs three new switches to a company's infrastructure. The network technician notices that all the switch port lights on the front of each switch flash rapidly when powered on and connected. Additionally, there are rapid flashing amber lights on the switches when they started up the next day. Which of the following describes what is occurring with the switches?**A.** The switches are having problems communicating with each other.**B.** The switches are connected and detected a spanning tree loop.**C.** The switches are not functioning properly and need to be disconnected.**D.** The switches are running through their spanning tree process.**Answer: D**

NEW QUESTION: 3On a corporate network, hosts on the same VLAN can communicate with each other, but they are unable to communicate with hosts on different VLANs. What is needed to allow communication between the VLANs?**A.** a switch with a trunk link that is configured between the switches**B.** a router with an IP address on the physical interface connected to the switch**C.** a router with subinterfaces configured on the physical interface that is connected to the switch**D.** a switch with an access link that is configured between the switches**Answer: C**Explanation:Different VLANs can't communicate with each other, they can communicate with the help of Layer3 router. Hence, it is needed to connect a router to a switch, then make the sub-interface on the router to connect to the switch, establishing Trunking links to achieve communications of devices which belong to different VLANs. When using VLANs in networks that have multiple interconnected switches, you need to use VLAN trunking between the switches. With VLAN trunking, the switches tag each frame sent between switches so that the receiving switch knows to what VLAN the frame belongs. End user devices connect to switch

ports that provide simple connectivity to a single VLAN each. The attached devices are unaware of any VLAN structure. By default, only hosts that are members of the same VLAN can communicate. To change this and allow inter-VLAN communication, you need a router or a layer 3 switch. Here is the example of configuring the router for inter-vlan communication

```
RouterA(config)#int f0/0.1
RouterA(config-subif)#encapsulation dot1Q 100
RouterA(config-subif)#ip address x.x.x.x y.y.y.y
```
