**NEW QUESTION: 1A.** Host Guardian Service**B.** Device Health Attestation**C.** Network Controller**D.** Hyper-V**Answer: A****Explanation:**Explanation

<https://blogs.technet.microsoft.com/datacentersecurity/2016/06/06/step-by-step-creating-shielded-vms-withoutvm> Shielding an existing VMLet's start with the simpler approach. This requires you to have a running VM on a host which is not the guarded host. This is important to distinguish, because you are simulating the scenario where a tenant wants to take an existing, unprotected VM and shield it before moving it to a guarded host. For clarity, the host machine which is not the guarded host will be referred to as the tenant host below. A shielded VM can only run on a trusted guarded host. The trust is established by adding the Host Guardian Service server role (retrieved from the HGSServer) to the Key Protector which is used to shield the VM. That way, the shielded VM can only be started after the guarded host successfully attests against the HGSServer. In this example, the running VM is named SVM. This VM must be generation 2 and have a supported OS installed with remote desktop enabled. You should verify the VM can be connected through RDP first, as it will almost certainly be the primary way to access the VM once it is shielded (unless you have installed other remoting capabilities).
