**NEW QUESTION: 1A. Option EB. Option DC. Option CD. Option BE. Option AAnswer: B,D,E**

**NEW QUESTION: 2**Your network contains a System Center 2012 Configuration Manager environment.You create a report named Report1. Report1 is used by multiple users.Users report that it takes too long to load Report1.You need to reduce the amount of time it takes to load Report1.What should you do?**A.** Decrease the session timeout value for the Reports website.**B.** Increase the size of the ReportServerTempDB database.**C.** Decrease the Size of the ReportServer database.**D.** Enable caching for the report.**Answer: D****Explanation:**Report caching can shorten the time it takes for a user to retrieve a report, particularly if the report is large or accessed frequently. When a report is requested, a query is sent to the database, an intermediate form of the report is cached on the report server, and the final report is rendered to the end user. Report caching forces the intermediate version of the report to be cached on the report server and provides a more consistent user experience with a reduced load on the database.

**NEW QUESTION: 3**You are the virtualization administrator for an organization that manages private and public cloud- based resources.The organization uses Windows Server 2012 R2 servers that have the Hyper-V role installed. All Hyper-V host serversare configured as nodes in a four-node cluster. The organization also uses System Center 2012 R2 ConfigurationManager. Operating system updates to each host server require a system reboot. You need to ensure that the virtualmachines remain online during any reboots required by the updates.What should you do?**A.** Apply updates by using the Virtual Machine Servicing Tool (VMST).**B.** In System Center 2012 R2 Configuration Manager, add all of the servers to a collection.Deploy updates to the collection.**C.** Configure orchestrated updates of Hyper-V host clusters in System Center 2012 R2 Virtual Machine Manager(VMM).**D.** Implement cluster-aware updating with the Cluster-Aware Updating (CAU) wizard.**Answer: D****Explanation:**CAU is a tool that coordinates software updates on a cluster node, and Configuration Manager also performs serversoftware updates. It is important to configure these tools so that they do not have overlapping coverage of the sameservers in any data-center deployment. This ensures that the objective behind using CAU is not inadvertentlydefeated, because Configuration Manager-driven updating does not incorporate cluster awareness.CAU and Configuration Manager can work together to deliver synergistic value. By using the public plug-in interfacearchitecture in CAU, Configuration Manager can leverage the cluster awareness of CAU. This allows a customer whoalready has Configuration Manager deployed to use the cluster awareness capabilities of CAU while taking advantageof the Configuration Manager infrastructure, such as distribution points, approvals, and the Configuration console.<http://technet.microsoft.com/en-us/library/hh831367.aspx>
