NEW QUESTION: 1You want to create a data volume on aggr0 and you receive a message with the following warning: "Warning: You are about to create a volume on a root aggregate. This may cause severe performance or stability problems and therefore is not recommended. Do you want to proceed?" What is the reason for this severe performance or stability problem?**A.** The performance load generated by the vol0 cannot be shared with any other volume on aggr0, requiring a dedicated aggregate for it.**B.** Controller failover and storage failover are separate processes that must occur in parallel, otherwise problems will arise.**C.** Controller failover and storage failover are separate processes that must occur at different times, otherwise problems will arise.**D.** The performance load generated by the data volume can be very strong, so it should not be shared with vol0 on aggr0, requiring a separate aggregate for it.**Answer: D**
Explanation: One possible cause is Disk I/O contention on the data volume. The root volume in Cluster-Mode is used to store and update various tables of the replicated database. Crucial information regarding the locations of LIFs, volumes, aggregates, and different jobs required to run in the cluster are stored in these tables. If a root aggregate has very busy data volumes, the disks in the aggregate will experience higher latency. When a node is unable to update its copy of the replicated database fast enough, it will consider itself unhealthy and stop serving all the data until it can catch up. This is extremely disruptive and affects all the volumes on the node, even if the cause is related to the data volumes stored on the root aggregate only. Reference: Why is a warning displayed when attempting to create one or more data volumes in the root aggregate in Data ONTAP Cluster-Mode?

NEW QUESTION: 3 Which three items must be configured in the port profile client in Cisco UCS Manager? (Choose three.)
A. folder **B.** port profile **C.** VM port group **D.** data center **E.** vCenter IP address **F.** DVS
Answer: A, D, F
Explanation: After associating an ESX host to a DVS, you can migrate existing VMs from the vSwitch to the DVS, and you can create VMs to use the DVS instead of the vSwitch. With the hardware-based VN-Link implementation, when a VM uses the DVS, all VM traffic passes through the DVS and ASIC-based switching is performed by the fabric interconnect. In Cisco UCS Manager, DVSes are organized in the following hierarchy: vCenter Folder (optional) Datacenter Folder (required) DVS At the top of the hierarchy is the vCenter, which represents a VMware vCenter instance. Each vCenter contains one or more datacenters, and optionally vCenter folders with which you can organize the datacenters. Each datacenter contains one or more required datacenter folders. Datacenter folders contain the DVSes.
