**NEW QUESTION: 1** Cisco Unified Contact Center Enterprise is deployed with Cisco Finesse and you make changes to CTI Server, Contact Center Enterprise Administration, or cluster settings. Which service must be restarted for changes to take effect?**A.** Cluster Manager**B.** System Application Agent**C.** Cisco Dirsync**D.** Cisco DBE. Cisco Tomcat**Answer: E**

**NEW QUESTION: 2** Which of the following could be used as a second component of multifactor authentication if a user has an RSA token?**A.** Access card**B.** Retina scan**C.** RFID**D.** USB thumb drive**Answer: B**  
Explanation: Explanation A retina scan could be used in conjunction with an RSA token because it is a biometric factor, and thus a different type of factor. An access card, RFID, and USB thumb drive are all items in possession of a user, the same as an RSA token, and as such would not be appropriate.

**NEW QUESTION: 3** What is the combined VaR of two securities that are perfectly positively correlated.**A.** The difference of the two VaRs.**B.** The sum of the individual VaRs of the two securities.**C.** Combined VaR cannot be derived using the available information.**D.** The root of the sum of squares of the individual VaRs of the two securities.**Answer: B**  
Explanation: Explanation Choice 'b' is the correct answer. When two securities have a correlation of +1, they are effectively the same security. In such cases, the standard deviations of the two securities are additive, which means the VaRs can simply be added together to get the combined VaR. All the other choices are incorrect. Choice 'c' in particular would have been correct if the securities were completely uncorrelated, ie if they had a correlation of zero. Choice 'a' would have been correct if their correlation were -1.

**NEW QUESTION: 4** **A.** Option B**B.** Option A**Answer: A**  
Explanation: Explanation With X\_ABORT ON the INSERT INTO statement and the transaction will be rolled back when an error is raised, it would then not be possible to ROLLBACK it again in the IF XACT\_STATE() <> 0 ROLLACK

TRANSACTION statement. Note: A transaction is correctly defined for the INSERT INTO ..VALUES statement, and if there is an error in the transaction it will be caught and the transaction will be rolled back, finally an error 51000 will be raised. Note: When SET XACT\_ABORT is ON, if a Transact-SQL statement raises a run-time error, the entire transaction is terminated and rolled back. XACT\_STATE is a scalar function that reports the user transaction state of a current running request. XACT\_STATE indicates whether the request has an active user transaction, and whether the transaction is capable of being committed. The states of XACT\_STATE are: 0 There is no active user transaction for the current request. 1 The current request has an active user transaction. The request can perform any actions, including writing data and committing the transaction. 2 The current request has an active user transaction, but an error has occurred that has caused the transaction to be classified as a committable transaction.
