**NEW QUESTION: 4** Refer to the exhibit. Each of these four switches has been configured with a hostname, as well as being configured to run RSTP. No other configuration changes have been made. Which three of these show the correct RSTP port roles for the indicated switches and interfaces? (Choose three.)  
**A.** SwitchA, Fa0/1, root  
**B.** SwitchB, Gi0/1, designated  
**C.** SwitchD, Gi0/2, root  
**D.** SwitchA, Fa0/2, designated  
**E.** SwitchB, Gi0/2, root  
**F.** SwitchC, Fa0/2, root  
**Answer: A,C,D**  
Explanation: The question says "no other configuration changes have been made" so we can understand these switches have the same bridge priority. Switch C has lowest MAC address so it will become root bridge and 2 of its ports (Fa0/1 & Fa0/2) will be designated ports. Because Switch C is the root bridge so the 2 ports nearest Switch C on Switch A (Fa0/1) and Switch D (Gi0/2) will be root ports. Now we come to the most difficult part of this question have a root port so which port will it choose? To answer this question we need to know about STP cost and port cost. In general, "cost" is calculated based on bandwidth of the link. The higher the bandwidth on a link, the lower the value of its cost. Below are the cost values you should memorize: Switch B will choose the interface with lower cost to the root bridge as the root port so we must calculate the cost on interface Gi0/1 & Gi0/2 of Switch B to the root bridge. This can be calculated from the "cost to the root bridge" of each switch because a switch always

advertises its cost to the root bridge in its BPDU. The receiving switch will add its localport cost value to the cost in the BPDU. One more thing to notice is that a root bridge always advertises the cost to the root bridge (itself) with an initial value of 0. Now let's have a look at the topology again. Switch C advertises its cost to the root bridge with a value of 0. Switch D adds 4 (the cost value of 1Gbps link) and advertises this value (4) to Switch B. Switch B adds another 4 and learns that it can reach Switch C via Gi0/1 port with a total cost of 8. The same process happens for Switch A and Switch B learns that it can reach Switch C via Gi0/2 with a total cost of 23 -> Switch B chooses Gi0/1 as its root port ->. Now our last task is to identify the port roles of the ports between Switch A & Switch B. It is rather easy as the MAC address of Switch A is lower than that of Switch B so Fa0/2 of Switch A will be designated port while Gi0/2 of Switch B will be alternative port. Below summaries all the port roles of these switches: + DP: Designated Port (forwarding state) + RP: Root Port (forwarding state) + AP: Alternative Port (blocking state)
