NEW QUESTION: 1You deleted billions of records from several tables in the SAP HANA database. However, the file system for the data volumes did not gain any free space. What is the reason? Please choose the correct answer. Choose one:**A.** You did not execute the ALTER SYSTEM RECLAIM LOG**B.** SAP HANA did not trigger a delta merge yet.**C.** You did not execute a full backup and restore to reduce the size of the data volumes.**D.** SAP HANA keeps the space for later reuse.**Answer: D**

NEW QUESTION: 2Which of the following choices describe a condition when RAM and Secondary storage are used together?**A.** Virtual storage**B.** Real storage**C.** Primary storage**D.** Secondary storage**Answer: A**Explanation: Virtual storage is a service provided by the operating system where it uses a combination of RAM and disk storage to simulate a much larger address space than is actually present. Infrequently used portions of memory are paged out by being written to secondary storage and paged back in when required by a running program. Most OS's have the ability to simulate having more main memory than is physically available in the system. This is done by storing part of the data on secondary storage, such as a disk. This can be considered a virtual page. If the data requested by the system is not currently in main memory, a page fault is taken. This condition triggers the OS handler. If the virtual address is a valid one, the OS will locate the physical page, put the right information in that page, update the translation table, and then try the request again. Some other page might be swapped out to make room. Each process may have its own separate virtual address space along with its own mappings and protections. The following are incorrect answers: Primary storage is incorrect. Primary storage refers to the combination of RAM, cache and the processor registers. Primary Storage The data waits for processing by the processors, it sits in a staging area called primary storage. Whether implemented as memory, cache, or registers (part of the CPU), and regardless of its location, primary storage stores data that has a high probability of being requested by the CPU, so it is usually faster than long-term, secondary storage. The location where data is stored is denoted by its physical memory address. This memory register identifier remains constant

and is independent of the value stored there. Some examples of primary storage devices include random-access memory (RAM), synchronous dynamic random-access memory (SDRAM), and read-only memory (ROM). RAM is volatile, that is, when the system shuts down, it flushes the data in RAM although recent research has shown that data may still be retrievable. Contrast thisSecondary storage is incorrect. Secondary storage holds data not currently being used by the CPU and is used when data must be stored for an extended period of time using high-capacity, nonvolatile storage. Secondary storage includes disk, floppies, CD's, tape, etc. While secondary storage includes basically anything different from primary storage, virtual memory's use of secondary storage is usually confined to high-speed disk storage. Real storage is incorrect. Real storage is another word for primary storage and distinguishes physical memory from virtual memory.
