**NEW QUESTION: 2**Which process is usually a rapid and cost-effective means of establishing priorities for Plan Risk Responses?  
**A.** Perform Quantitative Risk Analysis  
**B.** Perform Qualitative Risk Analysis  
**C.** Identify Risks  
**D.** Plan Risk Management  
**Answer: B**  
**Explanation:**  
Explanation/Reference:Explanation:Perform Qualitative Risk Analysis assesses the priority of identified risks using their relative probability or likelihood of occurrence, the corresponding impact on project objectives if the risks occur, as well as other factors such as the time frame for response and the organization's risk tolerance associated with the project constraints of cost, schedule, scope, and quality. Such assessments reflect the risk attitude of the project team and other stakeholders. Effective assessment therefore requires explicit identification and management of the risk approaches of key participants in the Perform Qualitative Risk Analysis process. Where these risk approaches introduce bias into the assessment of identified risks, attention should be paid to identifying bias and correcting for it. Establishing definitions of the levels of probability and impact can reduce the influence of bias. The time criticality of risk-related actions may magnify the importance of a risk. An evaluation of the quality of the available information on project risks also helps to clarify the assessment of the risk's importance to the project. Perform Qualitative Risk Analysis is usually a rapid and cost-effective means of establishing priorities for Plan Risk Responses and lays the foundation for Perform Quantitative Risk Analysis, if required. The Perform Qualitative Risk Analysis process is performed regularly throughout the project life cycle, as defined in the project's risk management plan. This process can lead into Perform Quantitative Risk Analysis (Section 11.4) or directly into Plan Risk Responses (Section 11.5).  
**Process:** 11.3 Perform Qualitative Risk Analysis  
**Definition:** The process of prioritizing risks for further analysis or action by assessing and combining their probability of occurrence and impact.  
**Key Benefit:** The key benefit of this process is that it enables project managers to reduce the level of uncertainty and to focus on high-priority risks.  
**Inputs**  
1. Risk management plan  
2. Scope baseline  
3. Risk register  
4. Enterprise environmental factors  
5. Organizational process assets  
**Tools & Techniques**

2. Probability and impact matrix  
3. Risk data quality assessment  
4. Risk categorization  
5. Risk urgency assessment  
6. Expert judgment  
**Outputs**  
1. Project documents updates

**NEW QUESTION: 3**You have virtual machines (VMs) that run a mission-critical application. You

need to ensure that the VMs never experience down time. What should you recommend? To answer, drag the appropriate solutions to the correct scenarios. Each solution may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content. NOTE: Each correct selection is worth one point. **Answer:** Explanation: Explanation Box 1: Scale set A virtual machine scale set allows you to deploy and manage a set of identical, autoscaling virtual machines. Box 2: Availability Set An Availability Set is a logical grouping capability for isolating VM resources from each other when they're deployed. Azure makes sure that the VMs you place within an Availability Set run across multiple physical servers, compute racks, storage units, and network switches. If a hardware or software failure happens, only a subset of your VMs are impacted and your overall solution stays operational. Availability Sets are essential for building reliable cloud solutions. Box 3: Fault domain A fault domain is a logical group of underlying hardware that share a common power source and network switch, similar to a rack within an on-premises datacenter. As you create VMs within an availability set, the Azure platform automatically distributes your VMs across these fault domains. This approach limits the impact of potential physical hardware failures, network outages, or power interruptions.

**NEW QUESTION: 4** You configured a security policy permitting traffic from the trust zone to the DMZ zone, inserted the new policy at the top of the list, and successfully committed it to the SRX Series device. Upon monitoring, you notice that the hit count does not increase on the newly configured policy. In this scenario, which two commands would help you to identify the problem? (Choose two.) **A.** user@srx> show security shadow-policies from zone trust to zone DMZ **B.** user@srx> show security zones trust detail **C.** user@srx> show security match-policies from-zone trust to-zone DMZ source-ip 192.168.10.100/32 destination-ip 10.10.10.80/32 protocol tcp source-port 5806 destination-port 443 **D.** user@srx> show security match-policies from-zone trust to-zone DMZ source-ip 192.168.10.100/32 destination-ip 10.10.10.80/32 protocol tcp source-port 5806 destination-port **Answer: A, D** Explanation: 443 result-count 10
