**NEW QUESTION: 1** A security analyst needs to logon to the console to perform maintenance on a remote server. Which of the following protocols would provide secure access?  
**A.** SCP **B.** SSH **C.** SFTP **D.** HTTPS  
**Answer: B**  
**Explanation:** Secure Shell (SSH) is a tunneling protocol originally used on Unix systems. It's now available for both Unix and Windows environments. SSH is primarily intended for interactive terminal sessions. SSH is used to establish a command-line, text-only interface connection with a server, router, switch, or similar device over any distance.

**NEW QUESTION: 2** In its simplest state, a ledger \_\_\_\_\_.  
**A.** records the transfer of an asset between participants  
**B.** proves ownership on the Blockchain  
**C.** provides privacy to users on the Blockchain  
**D.** determines which node stores the assets  
**Answer: A**

**NEW QUESTION: 3** What type of key would you find within a browser's list of trusted root CA?  
**A.** Private key  
**B.** Symmetric key  
**C.** Recovery key  
**D.** Public key  
**Answer: D**  
**Explanation:** The public key would be found. The public key is used to validate the Digital Signature contained within the Digital Certificate. As you well know the private key would never be distributed and only the owner of the certificate would have a copy of the private key. In cryptography and computer security, a root certificate is either an unsigned public key certificate or a self-signed certificate that identifies the Root Certificate Authority (CA). A root certificate is part of a public key infrastructure scheme. The most common commercial variety is based on the ITU-T X.509 standard, which normally includes a digital signature from a certificate authority (CA). Digital certificates are verified using a chain of trust. The trust anchor for the digital certificate is the Root Certificate Authority (CA). A certificate authority can issue multiple certificates in the form of a tree structure. A root certificate is the top-most certificate of the tree, the private key of which is used to "sign" other certificates. All certificates immediately below the root certificate inherit the trustworthiness of the root certificate a signature by a root certificate is somewhat analogous to "notarizing" an identity in the physical world. Certificates further down the tree also depend on the trustworthiness of the intermediates (often known as "subordinate certification authorities"). Many software applications assume these root certificates are trustworthy on the user's behalf. For example, a web browser uses them to verify identities within SSL/TLS secure connections. However, this implies that the user trusts their browser's publisher, the certificate authorities it trusts, and any intermediates the certificate authority

may have issued a certificate-issuing certificate, to faithfully verify the identity and intentions of all parties that own the certificates. This (transitive) trust in a root certificate is the usual case and is integral to the X.509 certificate chain model. The root certificate is usually made trustworthy by some mechanism other than a certificate, such as by secure physical distribution. For example, some of the most well-known root certificates are distributed in the Internet browsers by their manufacturers. The following answers are incorrect: The Private Key is never distributed, only the owner would have a copy of the private key. Symmetric keys have no direct relation to Public Key cryptosystems. A recovery key is usually used with full drive encryption tool when a user has lost or damaged his key.
