The cost (also called metric) of an interface in OSPF is an indication of the overhead  
required to send packets across a certain interface. The cost of an interface is inversely  
proportional to the bandwidth of that interface. A higher bandwidth indicates a lower cost.  
There is more overhead (higher cost) and time delays involved in crossing a 56k serial line than  
crossing a 10M Ethernet line. The formula used to calculate the cost is:Cost = 10000  
0000/bandwidth in bpsFor example, it will cost 10 EXP8/10 EXP7 = 10 to cross a 10MEthernet  
line and will cost 10 EXP8/1544000 =64 to cross a T1 line.By default, the cost of an interface is  
calculated based on the bandwidth; you can force the cost of an interface with the ip ospf cost  
<value> interface subconfiguration mode command.
