**NEW QUESTION: 1**A data analytics company has been building its now generation big data and analytics platform on Oracle Cloud Infrastructure (OCI). They need a storage service that provide the scale and performance that their big data applications require such as high throughput to compute nodes with low latency file operations in addition, their data needs to be stored redundantly across multiple nodes in a single availability domain and allows concurrent connections from multiple compute instances hosted on multiple availability domains. Which OCI storage service can you use to meet this requirement?**A.** Object Storage**B.** Block Volume**C.** Archive storage**D.** File System Storage**Answer: D**

**NEW QUESTION: 2**DRAG DROP You have a file server named File1 that runs Windows Server 2012. File1 has five physical disks. You plan to create a highly available network share named Share1. You need to create Share1 on File1. The solution must ensure that Share1 is available if a single disk fails. Which four actions should you perform?**Answer:** Explanation: Explanation: Create a parity virtual disk. Create a simple volume. Create and attach a VHD. Create a storage pool.

**NEW QUESTION: 3**Your network contains a server named Server1 that runs Windows Server 2012. Server1 has the Hyper-V server role installed. Server1 hosts four virtual machines named VM1, VM2, VM3, and VM4. Server1 is configured as shown in the following table. VM3 is used to test applications. You need to prevent VM3 from synchronizing its clock to Server1. What should you configure?**A.** Integration Services**B.** Single-root I/O virtualization**C.** Processor Compatibility**D.** The VLAN ID**E.** The startup order**F.** Resource metering**G.** Port mirroring**H.** Virtual Machine Chimney**I.** Resource control**J.** NUMA topology**K.** Automatic Start Action**Answer: A**

**NEW QUESTION: 4**Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals. Some question sets might have more than one correct solution, while others might not have a correct solution. After you answer a question in this section, you will NOT be able to return to it. As a result, these questions will not appear in the review screen. You are analyzing a numerical dataset which contains missing values in several columns. You must clean the missing values using an appropriate operation without affecting the dimensionality of the feature set. You need to analyze a full dataset to include all values. Solution: Replace each missing value using the Multiple Imputation by Chained Equations (MICE) method. Does the solution meet the goal?**A.** Yes**B.** No**Answer: A**Explanation: Replace using MICE: For each missing value, this option assigns a new value, which is calculated by using a method described

in the statistical literature as "Multivariate Imputation using Chained Equations" or "Multiple Imputation by Chained Equations". With a multiple imputation method, each variable with missing data is modeled conditionally using the other variables in the data before filling in the missing values. Note: Multivariate imputation by chained equations (MICE), sometimes called "fully conditional specification" or "sequential regression multiple imputation" has emerged in the statistical literature as one principled method of addressing missing data. Creating multiple imputations, as opposed to single imputations, accounts for the statistical uncertainty in the imputations. In addition, the chained equations approach is very flexible and can handle variables of varying types (e.g., continuous or binary) as well as complexities such as bounds or survey skip patterns.
