NEW QUESTION: 2

ある組織が、フロントエンドWebアプリケーション開発のためのアジャイル開発プロセスを実装しました。新しいセキュリティアーキテクトが入社したばかりで、セキュリティ活動をSDLCに統合したいと考えています。

セキュリティの観点からコードの品質を保証するために義務付けられているのは、次のうちどれですか。(2を選択) **A.** セキュリティ設計は要求フェーズの終わりに実行されます **B.**

セキュリティ要件が理解されていることを確認するために毎日のスタンドアップ会議が開催されず **C.** セキュリティ要件が盛り上がって構築されている **D.**

主要な反復侵入テストごとに実行されます **E.**

セキュリティ基準とトレーニングはプロジェクトの一環として実行されます **F.**

統合の一環として静的および動的分析が実行されます **Answer: D, F** Explanation: SDLC stands for systems development life cycle. An agile project is completed in small sections called iterations. Each iteration is reviewed and critiqued by the project team. Insights gained from the critique of an iteration are used to determine what the next step should be in the project. Each project iteration is typically scheduled to be completed within two weeks. Static and dynamic security analysis should be performed throughout the project. Static program analysis is the analysis of computer software that is performed without actually executing programs (analysis performed on executing programs is known as dynamic analysis). In most cases the analysis is performed on some version of the source code, and in the other cases, some form of

the object code. For each major iteration penetration testing is performed. The output of a major iteration will be a functioning part of the application. This should be penetration tested to ensure security of the application. Incorrect Answers: B: Security standards and training does not ensure code quality from a security perspective. The only way to ensure code quality is to test the code itself. C: Ensuring security requirements are understood does not ensure code quality from a security perspective. The only way to ensure code quality is to test the code itself. E: Storyboarding security requirements does not ensure code quality from a security perspective. The only way to ensure code quality is to test the code itself. F: A security design does not ensure code quality from a security perspective. The only way to ensure code quality is to test the code itself. NEW QUESTION: 4 HOTSPOT CASE STUDY Overview Woodgrove Bank is a technology company located in Seattle. Woodgrove Bank recently acquired a company named Contoso, Ltd. Existing Environment Active Directory Environment The network contains a single Active Directory production forest named woodgrovebank.com. Currently, there is no trust relationship between the Active Directory forests of Woodgrove Bank and Contoso. Network Environment Woodgrove Bank has a perimeter network that hosts Internet-facing servers. Woodgrove Bank uses Hyper-V Network Virtualization to isolate its production, development, and test environments. Woodgrove Bank has a Microsoft Azure subscription. System Center Environment Woodgrove Bank deploys infrastructure servers that host the following System Center 2012 R2 components. Operations Manager Data Protection Manager (DPM) Virtual Machine Manager (VMM) Woodgrove Bank plans to deploy Service Provider Foundation, System Center 2012 R2 Orchestrator, and System Center 2012 R2 Service Manager. All of the internal Hyper-V hosts and the file servers on the Woodgrove Bank network are registered with VMM. VMM and Windows Server Update Services (WSUS) are integrated. Woodgrove Bank has three VMM logical networks intended for clients, management, and storage. Each VMM logical network is configured to use a host group of All Hosts. The Operations Manager agent is deployed to each server. On-premises Computing and Application Environment The main office has the servers configured as shown in the following table. Server5 and Server6 were added to VMM by using explicit user credentials. A Windows update named Update1 is part of the baseline assigned to All Hosts. Server3 is configured to have a 2-TB storage pool. Tapes are used for long term backup. An application named App2 is installed on Server9. App2 requires complex installation and manual setup. Requirements Planned Changes Woodgrove Bank plans to implement the following changes: Deploy Service Manager. Integrate Orchestrator and Service Manager. Deploy all of the components of Orchestrator. Deploy Service Provider Foundation to Server2. Replace

the tape backups with Microsoft Azure Backup. Use a domain account named WOODGROVEBANKvmmuser1 to view and modify the IP address space in IPAM. Provide additional SMB storage to Server7 from Server5. Provide additional iSCSI storage to Server7 from Server5. Connectivity Requirements Woodgrove Bank identifies the following connectivity requirements: Minimize the Internet bandwidth used by the backups. Create a logical switch that will allow you to restrict host access to the logical networks of the clients only. Provide external connectivity to the virtual machine networks that are isolated from the clients by using the Network Virtualization using Generic Routing Encapsulation (NVGRE) gateway. Application Requirements Woodgrove Bank identifies the following application requirements: Minimize the number of VMM service template versions used to deploy App1. Create Server App-V packages while minimizing the impact on the existing environment. Deploy five instances of a multi-tier application named App1 by using a VMM service template. Each instance will have different deployment settings. Compliance Requirements Woodgrove Bank identifies the following compliance requirements: Use the principle of least privilege, whenever possible. Leverage Azure-based services for assessing the on-premises environment. Exclude Server7 from the installation of Update1. The missing patch must not affect the compliance status of Server7 against the baseline assigned to All Hosts. Manageability Requirements Integrate VMM and IPAM. Minimize administrative effort. Ensure that all Hyper-V hosts can be managed by using VMM. Use Service Provider Foundation to implement usage metering to manage the costs of the virtual machines used on the isolated development and test networks. Ensure that the Orchestrator infrastructure is resilient, so that if a single server fails, Service Manager automated workflows that use runbook automation activities can run. You need to identify which prerequisites are required to deploy Service Provider Foundation. The solution must meet the manageability requirements. Which prerequisites should you identify? To answer, select the appropriate options in the answer area. Hot Area: **Answer:** Explanation: Explanation/Reference:
