You take a snapshot of VM1, and then you install an application on VM1. You verify that the application runs properly. You can take multiple snapshots of a virtual machine, even while it is running. You can then revert the virtual machine to any of the previous states by Applying a snapshot to the virtual machine. Taking a snapshot of a VM is to in essence freeze the current state and make it a parent disk based on current state, and at the same time create a child disk to capture all subsequent changes.- See more at:Snapshots require adequate storage

space. Snapshots are stored as .avhd files in the same location as the virtual hard disk. Taking multiple snapshots can quickly consume a large amount of storage space. When you use Hyper-V Manager to delete a snapshot, the snapshot is removed from the snapshot tree but the .avhd file is not deleted until you turn off the virtual machine.
