NEW QUESTION: 2Merlyn works as a Database Administrator for DOW Inc. She is currently designing a database. She wants to break down the preliminary specifications into smaller components so that each component describes a basic fragment of the specifications. Which of the following approaches is she using?**A.** Inside-out approach**B.** Bottom-up approach**C.** Mixed approach**D.** Top-down approach**Answer: B****Explanation:**In a bottom-up approach, the preliminary specifications are broken down into smaller components so that each component describes a basic fragment of the specifications. These components are then represented by schemas, some of which may consist of single concepts. The schemas are later obtained to be integrated together until a final schema is obtained.**Answer C** is incorrect. In a mixed approach, the designer decomposes the requirements into a number of components, as in the bottom-up approach, but not to the extent where all the concepts are separated. At the same time, a skeleton schema is defined containing the main concepts of the application. This skeleton schema gives a unified view of the whole design and helps the integration of schemas developed separately. Then the designer examines separately these main concepts and can proceed with gradual refinements following the top-down approach or extending a portion with concepts that are not yet represented following the bottom-up approach.**Answer A** is incorrect. Inside-out approach can be regarded as a particular type of bottom-up approach. It begins with the identification of only a few important concepts and, based on these, the design proceeds, spreading outward 'radially'. First the concepts nearest to the initial concepts are represented, and a user then moves towards those further away by means of 'navigation' through the specification.**Answer B** is incorrect. In a top-down approach, a schema is created through a series of successive refinements, starting from the first schema, which is gradually expanded by using appropriate modifications that increase the detail of the various concepts. Moving from one level to another, the schema is modified using some basic transformations called top-down transformation primitives.
