**NEW QUESTION: 2**You use a centralized identity management system as a source of authority for user account information. You export a list of new user accounts to a file on a daily basis. Your company uses a local Active Directory for storing user accounts for on-premises solutions. You are also using Azure AD Connect.New user accounts must be created in both the local Active Directory and Office 365. You must import user account data into Office 365 daily.You need to import the new users.What should you do?**A.** Create a Windows PowerShell script to import account data from the file into Active Directory.**B.** Use the Office 365 admin center to import the file.**C.** Use the Azure Management Portal to import the file.**D.** Create a Windows PowerShell script that uses the MSOnline module to import account data from the file.**Answer:** **A**Explanation:To force a full sync with the Azure AD Connect tool from Windows PowerShell run Import-Module ADSync followed by Start-ADSyncSyncCycle -PolicyType Initial Note: The

DirSync tool, which you can use to synchronize your on-premises Active Directory Domain Services (AD DS) with an instance of Azure Active Directory (AD), has been updated with the new Azure AD Connect tool. You typically use the DirSync or Azure AD Connect tools to configure either password synchronization or single sign-on so that your users can use their on-premises AD DS credentials to authenticate to Office 365. **NEW QUESTION: 3** You have a database named WideWorldImporters that contains the following tables: TableA and TableB. Both tables are legacy tables. TableA contains a column that uses the ntext data type. TableB contains a column that uses the nvarchar(max) data type. The indexes in each table have become highly fragmented. You must reduce the fragmentation in both tables. You must permit concurrent user queries during defragmentation, even if the queries take longer to complete than usual. When possible, the REBUILD option is preferred. Table statistics must be updated at the end of this maintenance. In the table below, identify the strategy that must be used for each table. NOTE: Make only one selection in each column. Each correct selection is worth one point. **Answer:** Explanation: Explanation TableA: REBUILD ... WITH (ONLINE = OFF) The data types image, ntext, and text can be rebuild offline only. TableB: REBUILD ... WITH (ONLINE = ON) You CAN do online index rebuilds of varchar(max), nvarchar(max), and varbinary(max) data types. Note: When an index is created or rebuilt in SQL Server, statistics are created or updated by scanning all the rows in the table. However, starting with SQL Server 2012 (11.x), statistics are not created or updated by scanning all the rows in the table when a partitioned index is created or rebuilt. Instead, the query optimizer uses the default sampling algorithm to generate these statistics. To obtain statistics on partitioned indexes by scanning all the rows in the table, use CREATE STATISTICS or UPDATE STATISTICS with the FULLSCAN clause.
