NEW QUESTION: 1Which statement describes DTMF processing on Cisco Unified Contact Center Express with supported SIP-based agent IP phones that are registered to Cisco Unified Communications Manager?**A.** Cisco Unified CCX receives the DTMF digits via JTAPI messages.**B.** Cisco Unified CCX receives the DTMF digits as part of the audio encoding in the RTP stream.**C.** Cisco Unified CCX receives the DTMF digits via SIP INFO messages.**D.** Cisco Unified CCX receives the DTMF digits via SIP NOTIFY messages.**E.** Cisco Unified CCX receives the DTMF digits in the RTP payload based on RFC 2833.**Answer: A**Explanation:Explanation/Reference:Explanation: Unified CCX CTI ports are notified of caller-entered digits (DTMF input) via JTAPI messages from Unified CM. Unified CCX does not support any mechanism to detect in-band DTMF digits where DTMF digits are sent with voice packets. In deployments with voice gateways or SIP phones that only support in-band DTMF or are configured to use in-band DTMF, an MTP resource must be invoked by Unified CM to convert the in-band DTMF signaling so that Unified CM can notify Unified CCX of the caller-entered digits. Be sure to enable out-of-band DTMF signaling when configuring voice gateways in order to avoid using the previous MTP resources.References: http://www.cisco.com/en/US/docs/voice_ip_comm/cust_contact/contact_center/crs/express_9_02/design/guide/UCCX_BK_C39FDB35_00_cisco-unified-contact-center-express_chapter_010.html

NEW QUESTION: 3Which two characteristics of the TACACS+ protocol are true? (Choose two.)**A.** is an open RFC standard protocol**B.** separates AAA functions**C.** uses UDP ports 1645 or 1812**D.** offers extensive accounting capabilities**E.** encrypts the body of every packet**Answer: B,E**Explanation:

http://www.cisco.com/en/US/tech/tk59/technologies_tech_note09186a0080094e99.shtml
Packet Encryption RADIUS encrypts only the password in the access-request packet, from the client to the server. The remainder of the packet is unencrypted. Other information, such as username, authorized services, and accounting, can be captured by a third party. TACACS+ encrypts the entire body of the packet but leaves a standard TACACS+ header. Within the header is a field that indicates whether the body is encrypted or not. For debugging purposes, it is useful to have the body of the packets unencrypted. However, during normal operation, the body of the packet is fully encrypted for more secure communications. Authentication and Authorization RADIUS combines authentication and authorization. The access-accept packets sent by the RADIUS server to the client contain authorization information. This makes it difficult to decouple authentication and authorization. TACACS+ uses the AAA architecture, which separates AAA. This allows separate authentication solutions that can still use TACACS+ for authorization and accounting. For example, with TACACS+, it is possible to use Kerberos authentication and TACACS+ authorization and accounting. After a NAS authenticates on a Kerberos server, it requests authorization information from a TACACS+ server without having to re-authenticate. The NAS informs the TACACS+ server that it has successfully authenticated on a Kerberos server, and the server then provides authorization information. During a session, if additional authorization checking is needed, the access server checks with a TACACS+ server to determine if the user is granted permission to use a particular command. This provides greater control over the commands that can be executed on the access server while decoupling from the authentication mechanism.
