NEW QUESTION: 2An administrator has enabled salting for users' passwords on a UNIX box. A penetration tester must attempt to retrieve password hashes. Which of the following files must the penetration tester use to eventually obtain passwords on the system? (Select TWO).**A.** /etc/shadow**B.** /etc/passwd**C.** /etc/security**D.** /sbin/logon**E.** /etc/password**F.** /bin/bash**Answer: A,B****Explanation:**ExplanationIn cryptography, a salt is random data that is used as an additional input to a one-way function that hashes a password or passphrase. In this question, enabling salting for users' passwords means to store the passwords in an encrypted format.Traditional Unix systems keep user account information, including one-way encrypted passwords, in a text file called "/etc/passwd". As this file is used by many tools (such as "ls") to display file ownerships, etc. by matching user id #'s with the user's names, the file needs to be world-readable. Consequentially, this can be somewhat of a security risk.Another method of storing account information is with the shadow password format. As with the traditional method, this method stores account information in the /etc/passwd file in a compatible format. However, the password is stored as a single "x" character (ie. not actually stored in this file). A second file, called "/etc/shadow", contains encrypted password as well as other information such as account or password expiration values, etc.
