NEW QUESTION: 1

追加のアクセスポートが必要な場合、スパインアンドリーフアーキテクチャはどのようにしてネットワークのスケラビリティを可能にしますか？**A.**

スパインスイッチとリーフスイッチは、それらの間の冗長接続で追加できます**B.**

すべてのスパインスイッチに接続するリーフスイッチを追加できます**C.**

スパインスイッチは少なくとも40GBのアップリンクで追加できます**D.**

リーフスイッチは、コアスパインスイッチへの単一の接続で追加できます。**Answer: B**

Explanation:Spine-leaf architecture is typically deployed as two layers: spines (such as an aggregation layer), and leaves (such as an access layer). Spine-leaf topologies provide high-bandwidth, low-latency, nonblocking server-to-server connectivity.Leaf (aggregation) switches are what provide devices access to the fabric (the network of spine and leaf switches) and are typically deployed at the top of the rack. Generally, devices connect to the leaf switches.Devices can include servers, Layer 4-7 services (firewalls and load balancers), and WAN or Internet routers. Leaf switches do not connect to other leaf switches. In spine-and-leaf architecture, every leaf should connect to every spine in a full mesh.Spine (aggregation) switches are used to connect to all leaf switches and are typically deployed at the end or middle of the row. Spine switches do not connect to other spine switches.

NEW QUESTION: 2Which type of SQL statement would be selected for tuning by the automatic SQL framework?**A.** Serial queries that have been tuned within the last 30days and have been SQL profiled by the SQL tuning Advisor.**B.** Serial and parallel queries that top the AWR Top SQL in the past week only and have been SQL profiled by the SQL Tuning Advisor.**C.** Serial queries that top the AWR Top SQL in the past week only and whose poor performance can be traced to concurrency issues.**D.** Serial and parallel queries that are among the costliest in any or all of the four categories: the past week, and day in the past week, any hour in the past week, or a single response, and that can benefit from access method changes.**E.** Serial queries that are among the costliest in any or all of the four categories: the past week, any day in the past week, any hour in the past week, or single response, and have the potential for improvement**Answer: D**

Explanation:The Automatic Tuning Optimizer is meant to be used for complex and high-load SQL statements that have non-trivial impact on the entire system. The AutomaticDatabase Diagnostic Monitor (ADDM) proactively identifies high-load SQL statementswhich are good candidates for SQL tuning.Note:*When SQL statements are executed by the Oracle database, the query optimizer is usedto generate the execution plans of the SQL statements. The query

optimizer operates into two modes: a normal mode and a tuning mode. In normal mode, the optimizer compiles the SQL and generates an execution plan. The normal mode of the optimizer generates a reasonable execution plan for the vast majority of SQL statements. Under normal mode, the optimizer operates with very strict time constraints, usually a fraction of a second, during which it must find a good execution plan. In tuning mode, the optimizer performs additional analysis to check whether the execution plan produced under normal mode can be improved further. The output of the query optimizer is not an execution plan, but a series of actions, along with their rationale and expected benefit for producing a significantly superior plan. When running in the tuning mode, the optimizer is referred to as the Automatic Tuning Optimizer. Reference: Oracle Database Performance Tuning Guide, Automatic SQL Tuning

NEW QUESTION: 3 Note: This question is part of a series of questions that present the same scenario. Each question in the series contains a unique solution that might meet the stated goals.
