Three switches are configured for HSRP.Switch1 remains in the HSRP listen state. What is the most likely cause of this status?**A.** The standby group number does not match the VLAN number.**B.** IP addressing is incorrect.**C.** Priority commands are incorrect.**D.** This is normal operation.**E.** Standby timers are incorrect.**Answer: D** Explanation:This is expected behavior. When HSRP is configured on an interface, the router progresses through a series of states before becoming active. This forces a router to listen for others in a group and see where it fits into the pecking order. Devices participating in HSRP must progress their interfaces through the following state sequence:1.Disabled2.Init3.Listen 4.Speak5.Standby6.ActiveOnly the standby (the one with the second-highest priority) router monitors the hello message from the active router. By default, hellos are sent every 3 seconds. If hellos are missed for the duration of the holdtime timer (default 10 seconds, or three times the hello timer), the active router is presumed to be down. The standby router is then clear to assume the active role. At that point, if other routers are sitting in the Listen state, the next-highest priority router is allowed to become the new standby router.Reference:CCNP

**NEW QUESTION: 3** A patient inquires about the therapeutic uses of marijuana. You know that marijuana is used for what therapeutic use? **A.** Stimulating appetite **B.** Antibacterial agent **C.** Stimulating the patient to become more organized and motivated **D.** Reducing stress **Answer: A**  
Explanation: Marijuana is used in AIDS patients to increase appetite. Marijuana does not increase the patient's motivation or organization, reduce stress or have antibacterial properties.

**NEW QUESTION: 4** Refer to the exhibit. All switches have default bridge priorities, and originate BPDUs with MAC addresses as indicated. The numbers shown are STP link metrics. After STP converges, you discover that traffic from switch SWG toward switch SWD takes a less optimal path. What can you do to optimize the STP tree in this switched network? **A.** Change the priority of switch SWA to a lower value than the default value. **B.** Change the priority of switch SWD to a lower value than the default value. **C.** Change the priority of switch SWB to a higher value than the default value. **D.** Change the priority of switch SWG to a higher value than the default value. **Answer: B**  
Explanation: In this topology, we see that all port paths and priorities are the same, so the lowest MAC address will be used to determine the best STP path. From SWG, SWE will be chosen as the next switch in the path because it has a lower MAC address than SWF. From SWE, traffic will go to SWC because it has a lower MAC address, and then to SWD, instead of going from SWE directly to SWD. If we lower the priority of SWD (lower means better with STP) then traffic will be sent directly to SWD.
