EC2 인스턴스는 아웃 바운드 인터넷 액세스를 위해 NAT 게이트웨이를 사용하지만 EC2 인스턴스는 소프트웨어 업데이트를 다운로드 하기 위해 퍼블릭 인터넷에 연결할 수 없습니다. 이 문제의 근본 원인은 무엇입니까? NEW QUESTION: 2 A developer implements a CMT session bean with a method storeBoth which inserts data both a related database and an LDAP server. The relational database supports transactions while the LDAP system does NOT. Given that both updates should succeed or be rolled back, which is the best solution?**A.** Implement the SessionSynchronization interface in the session bean. In the afterCompletion method, the LDAP inserts are rolled back if false is passed as an argument to the afterCompletion method.**B.** Define the transaction attribute of the method storeBoth as REQUIRED. The container manages the transactions and will roll back modifications if something goes wrong in either database insert or LDAP insert.**C.** Define the transaction attribute of the method storeBoth as REQUIRED_NEW. Carry out the LDAP insert first. If SessionContext.getRollBackOnly returns false, execute the database inserts, catching SQL exceptions. If exceptions are raised, call the SessionContext.setRollBackOnly.**D.** Define the transaction attribute of the method storeBoth as REQUIRED_NEW. Carry out the database insert first. Subsequently, execute the LDAP inserts, catching LDAP exceptions. If exceptions are raised, call the SessionContext.setRollBackOnly method.**Answer: D** Explanation: The method should start a new transaction, so we use the REQUIRED_NEW attribute. For the LDAP operation we can only detect LDAP exceptions. We cannot check the status of the LDAP operation through SessionContext.getRollBackOnly. Note: *CMT - Container-Managed Transactions* RequiresNew Attribute If the client is running within a transaction and invokes the enterprise bean's method, the container takes the following steps: Suspends the client's transaction Starts a new transaction Delegates the call to the method Resumes the client's transaction after the method completes If the client is not associated with a transaction, the container starts a new transaction before running the method. You should use the RequiresNew attribute when you want to ensure that the method always runs within a new transaction. Reference: The Java EE 5 Tutorial, Container-Managed Transactions
