D. it will send the Session-Timeout attribute in the RADIUS Access-Request packet to the NAD and the NAD will end the user's session after 600 seconds
Answer: B
Explanation: Explanation Session Timeout (in seconds) - Configure the agent session timeout interval to re-evaluate the system health again. OnGuard triggers auto-remediation using this value to enable or disable AV-RTP status check on endpoint. Agent re-authentication is determined based on session-time out value. NEW QUESTION: 4 **A.** Set-ADReplicationSiteLink
B. Set-ADGroup
C. Set-ADSite
D. Netdom
E. Set-ADForest
F. Set-ADReplicationSite
G. Set-ADDomain
Answer: F
Explanation: The Set-ADReplicationSite cmdlet is used to set the properties for an Active Directory site that is

being used for replication. Sites are used in Active Directory to either enable clients to discover network resources (published shares, domain controllers) close to the physical location of a client computer or to reduce network traffic over wide area network (WAN) links. Sites can also be used to optimize replication between domain controllers. The parameter -ReplicationSchedule<ActiveDirectorySchedule> specifies the default replication schedule for connections within this site (intra-site replication). Incorrect answers: Not A: Set-ADSite is a Microsoft Exchange 2013 command. Use the Set-AdSite cmdlet to configure the Exchange settings of Active Directory sites. Not D: The Set-ADReplicationSiteLink cmdlet sets properties on an Active Directory site link. A site link connects two or more sites. Replication site links reflect the administrative policy for how sites interconnect and the methods used to transfer replication traffic. You must connect sites with site links so that domain controllers at each site can replicate Active Directory changes. Not F: The Set-ADForest cmdlet modifies the properties of an Active Directory forest. Replication cannot be configured with this command.
