**NEW QUESTION: 1** A small retail company recently deployed a new point of sale (POS) system to all 67 stores. The core of the POS is an extranet site, accessible only from retail stores and the corporate office over a split-tunnel VPN. An additional split-tunnel VPN provides bi-directional connectivity back to the main office, which provides voice connectivity for store VoIP phones. Each store offers guest wireless functionality, as well as employee wireless. Only the staff wireless network has access to the POS VPN. Recently, stores are reporting poor response times when accessing the POS application from store computers as well as degraded voice quality when making phone calls. Upon investigation, it is determined that three store PCs are hosting malware, which is generating excessive network traffic. After malware removal, the information security department is asked to review the configuration and suggest changes to prevent this from happening again. Which of the following denotes the BEST way to mitigate future malware risk?**A.** Deploy new perimeter firewalls at all stores with UTM functionality.**B.** Deploy a proxy server with content filtering at the corporate office and route all traffic through it.**C.** Move to a VDI solution that runs offsite from the same data center that hosts the new POS solution.**D.** Change antivirus vendors at the store and the corporate office.**Answer: A****Explanation:**A perimeter firewall is located between the local network and the Internet where it can screen network traffic flowing in and out of the organization. A firewall with unified threat management (UTM) functionalities includes anti-malware capabilities.

**NEW QUESTION: 2** Tom has been tasked to install Check Point R80 in a distributed deployment. Before Tom installs the systems this way, how many machines will he need if he does NOT include a SmartConsole machine in his calculations?**A.** One machine, but it needs to be installed using SecurePlatform for compatibility purposes**B.** Two machines**C.** One machine**D.** Three machines**Answer: B**

**NEW QUESTION: 3** Which of the following is NOT a characteristic or shortcoming of packet filtering gateways?**A.** The source and destination addresses, protocols, and ports contained in the IP packet header are the only information that is available to the router in making a decision whether or not to permit traffic access to an internal network.**B.** They don't protect against IP or DNS address spoofing.**C.** They do not support strong user authentication.**D.** They are appropriate for medium-risk environment.**Answer: D****Explanation:**Explanation/Reference:

Explanation: Packet filtering was the first generation of firewalls and it is the most rudimentary type of all of the firewall technologies. Packet filtering gateways/firewalls would be insufficient for a medium-risk environment. Incorrect Answers: A: Packet filtering gateways can make access decisions based upon the following basic criteria: Source and destination IP addresses Source and destination port numbers Protocol types Inbound and outbound traffic direction B: Packet filters are useful in IP address spoofing attack prevention because they are capable of filtering out and blocking packets with conflicting source address information (packets from outside the network that show source addresses from inside the network and vice-versa). On the other hand packet filtering gateways would not be able to protect against DNS spoofing. A stateful firewall is needed to protect against DNS spoofing C: Packet filter gateways cannot ensure strong user authentication.
